Prism Printer Driver for Windows 2000/XP Release Note

Firmware version:

- 5.02

Changes:

- Adds support for 2-color printing. Any color other than black will be printed with the spot color. Halftoning is disabled in this mode. Images using 2-color printing should have limited grayscale (solid graphics are preferred). The spot color areas of the image print first. An image may be created in CMY or RGB colorspace.

- Adds support for mono-color printing with a 2-color ribbon. When a two-color ribbon is installed, selecting **Print Image** in Mono-color works correctly.

- Improves Windows 2000 color images with this release of the new Level 3 driver for Win2K/XP.

- Removes the RLE compression enable/disable option from the user interface; intelligent RLE is always enabled.

- Improves rendering performance; the new Level 3 driver renders images up to 10% faster than the old Level 2 driver.

- Fixes a slow print problem with USB connections (in the **Advanced** tab under **Rimage Perfect Image PF** properties, uncheck the Enable Advanced Printing Options checkbox).

- Always masks both the Inside Dimension (ID) and the Outside Dimension (OD). Image Masking is no longer a document property. Advanced users may modify the bitmap mask file to create features such as watermarking the image.
